2. login

```
# Login Page
@app.route("/", methods=["GET", "POST"])
def login():
    if request.method == "POST":
        username = request.form['username']
        password = request.form['password']

        # TODO # 4: Hash the password using SHA-256
        password = password.encode('utf-8')
        sha256 = hashlib.sha256()
        sha256.update(password)
        hash_value = sha256.hexdigest()

        # Connect to the database
        conn = get_db_connection()
        cursor = conn.cursor()

        # TODO # 2. Check if the user exists in the database and whether the password is correct
        # Query to check the user
        cursor.execute(f"SELECT password FROM users WHERE username = %s", (username,))
        result = cursor.fetchone() # fetchone() returns None if no record is found

        if result is None:
            flash("帳號或密碼錯誤", "danger")
        elif result[0] == hash_value:
            session['username'] = username
            return redirect("/welcome")
        else:
            flash("帳號或密碼錯誤", "danger")

        # Close the connection
        cursor.close()
        conn.close()

    return render_template("login.html")
```

- 1.先輸入帳密
- 2.把密碼轉成SHA256
- 3.把帳號轉成參數 ,從database裡面找那組帳密
- 4.如果沒找到或是錯誤就顯示錯誤
- 5.正確就進到welcome

3.Signup

```
# Signup
@app.route("/signup", methods=["GET", "POST"])
def signup():
    if request.method == "POST":
        username = request.form['username']
        password = request.form['password']

        # TODO # 4: Hash the password using SHA-256
        password = password.encode('utf-8')
        sha256 = hashlib.sha256()
        sha256.update(password)
        hash_value = sha256.hexdigest()

        # Connect to the database
        conn = get_db_connection()
        cursor = conn.cursor()

        # TODO # 3: Add the query to insert a new user into the database
        try:
            # Insert new user into the database
            cursor.execute(f" INSERT INTO users (username, password) VALUES (%s , %s);",(username, hash_value))
            conn.commit()
            flash("Account created successfully! Please log in.", "success")
            return redirect("/")
        except mysql.connector.Error as err:
            flash(f"Error: {err}", "danger")
        finally:
            cursor.close()
            conn.close()

    return render_template("signup.html")
```

• Error: 1062 (23000): Duplicate entry '蔡懷恩' for key 'users.username'

- 1.先輸入帳密
- 2.把密碼轉成SHA256
- 3.把帳號和SHA256的密碼insert到database
- 4.成功就回到login並顯示創建成功,請登入
- 5.錯誤就顯示錯誤

4.hash

```
import hashlib
```

```
# TODO # 4: Hash the password using SHA-256
password = password.encode('utf-8')
sha256 = hashlib.sha256()
sha256.update(password)
hash_value = sha256.hexdigest()
```

```
mysql> SELECT * FROM users;
```

id	username	password
8	wayne	a982c97d452cc71fde02409d6e6a623220c882930c3c13ab7733e61bc9870b6c

• 帳號或密碼錯誤

```
cursor.execute(f"SELECT password FROM users WHERE username = %s",(username,))
result = cursor.fetchone() # fetchone() returns None if no record is found

if result is None:
    flash("帳號或密碼錯誤","danger")
elif result[0]==hash_value:
    session['username'] = username
    return redirect("/welcome")
else:
    flash("帳號或密碼錯誤","danger")
```

方法: 跑進sql前, 把名稱變成一組參數, 就不會因為admin' OR '1'='1而出錯, 可以當作一組名稱去查詢

```
try:
    # Insert new user into the database
    cursor.execute(f" INSERT INTO users (username, password) VALUES (%s , %s);",(username, hash_value))
    conn.commit()
    flash("Account created successfully! Please log in.", "success")
    return redirect("/")
except mysql.connector.Error as err:
    flash(f"Error: {err}", "danger")
finally:
    cursor.close()
    conn.close()
```

signup: 可以把admin' OR '1'='1當作一組名稱來登錄
